

Theory

```
1 SELECT COUNT(*)
2 FROM company
3 WHERE status = 'closed';
```

⚠ This project doesn't require a submission. It includes 10 auto-graded tasks, similar to those in the sprint. Once you've completed all 10 tasks successfully, you can move on to the next sprint.

Welcome to your first week as a Data Analyst at VentureInsight, a leading research firm that provides analytics and insights to venture capital firms and startup investors. Our clients rely on our data-driven recommendations to make multi-million dollar investment decisions.

You've joined our team at an exciting time! We've just acquired a comprehensive database tracking venture funds, startups, acquisitions, and key people in the industry. Your manager has assigned you a series of analysis tasks that will help shape our upcoming quarterly investment report.

The database structure is shown in the following ER diagram:

Project: Exploring Startup Trends with SQL Task 1 / 10

Theory

```
1 SELECT COUNT(*)
2 FROM company
3 WHERE status = 'closed';
```

ER diagram of a database that stores information about venture funds and startup investments.

Project: Exploring Startup Trends with SQL Task 1 / 10

Passed You can continue Run Submit Task 2 → Rate task Next →

Theory

```
1 SELECT COUNT(*)
2 FROM company
3 WHERE status = 'closed';
```

ER diagram of a database that stores information about venture funds and startup investments.

You'll be working with these key tables:

- company Information about startups (funding, status, category)
- fund Details about venture capital funds
- funding_round Data on investment rounds
- investment Records of specific investments
- acquisition Information about company acquisitions
- people Details about founders, employees, and investors
- education Educational backgrounds

Project: Exploring Startup Trends with SQL Task 1 / 10

Passed You can continue Run Submit Task 2 → Rate task Next →

Theory

```
1 SELECT COUNT(*)
2 FROM company
3 WHERE status = 'closed';
```

Project: Exploring Startup Trends with SQL Task 1 / 10

1. Startup Landscape Analysis

Before diving into specific analyses, your first task is to understand the overall startup landscape in our database. The executive team needs a snapshot of how many companies have failed (closed down) versus how many are still operating or have been acquired. This will help establish the baseline success rate in the startup ecosystem.

Calculate the number of companies that have been closed down.

Relevant lessons

This task requires a basic `SELECT` statement with a `COUNT` aggregation and `WHERE` clause for filtering. If necessary, review the following lessons: "Tables and Databases" and "The `WHERE` Clause".

Theory

```
1 SELECT funding_total
2 FROM company
3 WHERE category_code = 'news' AND country_code = 'USA'
4 ORDER BY funding_total DESC;
```

Project: Exploring Startup Trends with SQL Task 2 / 10

2 Sector Analysis for US Investors

One of our major clients, a US-based VC firm, is considering investments in the media and news space. They've asked us to provide data on how much funding news-related companies from the USA have raised historically, to help them benchmark appropriate investment amounts.

Print the amount of money news-related companies from the USA have raised. Use data from the `company` table. Sort the resulting table by the `funding_total` field in descending order to see the most well-funded companies first.

Relevant lessons

This task builds on filtering data with multiple `WHERE` conditions and sorting results. If necessary, review the following lessons: "The `WHERE` Clause" and "Logical Operators".

Theory

```
1 SELECT SUM(price_amount)
2 FROM acquisition
3 WHERE term_code = 'cash'
4 AND (acquired_at >= '2011-01-01' AND acquired_at <= '2013-12-31');
```

Project: Exploring Startup Trends with SQL Task 3 / 10

3 Analyzing Cash Acquisitions

Our quarterly report includes a section on acquisition trends. The team needs to understand the volume of cash-based acquisitions (as opposed to stock deals) that occurred during the recent post-recession period (2011-2013). This data will help identify whether companies were primarily acquired with cash or other payment methods during this economic recovery period.

Find the total amount of company acquisitions in US dollars. Select only the deals made in cash from 2011 to 2013, inclusive.

Relevant lessons

If necessary, review the following lessons: "Data Types" and "The `WHERE` Clause", and "The `SUM` Function".

Theory

```
1 SELECT
2   first_name,
3   last_name,
4   twitter_username
5 FROM people
6 WHERE twitter_username LIKE 'Silver%';
```

Project: Exploring Startup Trends with SQL Task 4 / 10

4. Identifying Industry Influencers

Our marketing team is preparing an outreach campaign to industry influencers with strong social media presence. They're particularly interested in individuals who brand themselves with "Silver" in their Twitter handles, as this group seems to have significant industry clout. We need to identify these individuals for potential partnerships.

Print the first and last names of people whose Twitter usernames start with "Silver". Include their Twitter usernames in the results.

Relevant lessons

This task focuses on pattern matching in text fields. If necessary, review the following lessons: "Searching for Data in a Table: `LIKE`".

Theory

This project doesn't require a submission. It includes 10 auto-graded tasks.

Project: Exploring Startup Trends with SQL Task 5 / 10

5. Finding Finance Influencers

Following your initial influencer analysis, the marketing team has refined their focus. They're now looking specifically for finance-focused influencers (those with "money" in their Twitter handles) whose last names start with "K". This more targeted approach will help them connect with relevant industry voices for our upcoming FinTech investment report.

Print all information about people whose Twitter usernames include the word "money" somewhere in their name and whose last names start with "K".

Relevant lessons

This task extends your pattern matching skills with multiple conditions. If necessary, review the following lessons: "Searching for Data in a Table: LIKE" and "Logical Operators".

Result

id	first_name	last_name	company_id	twitter_username	created_at
63081	Gregory	Kim		gmoney75	2010-03-04

Code

```
1 SELECT *
2 FROM people
3 WHERE twitter_username LIKE '%money%' AND last_name LIKE 'KN';
```

Theory

This project doesn't require a submission. It includes 10 auto-graded tasks.

Project: Exploring Startup Trends with SQL Task 6 / 10

6. Geographic Investment Analysis

Our global investment clients need to understand funding patterns across different countries. They want to identify which countries attract the most venture capital to help them decide where to focus their international investment strategies. This geographic breakdown will be a key feature in our quarterly global trends report.

For each country, calculate the total amount of money raised by companies registered there. The country code will tell you where each company is registered. Sort the data by sum in descending order to highlight the countries with the most funding.

Relevant lessons

This task introduces grouping data and performing aggregate calculations on groups. If necessary, review the following lessons: "Grouping Data: GROUP BY" and "The SUM Function".

Result

id	first_name	last_name	company_id	twitter_username	created_at
63081	Gregory	Kim		gmoney75	2010-07-13 03:46:28

Theory

This project doesn't require a submission. It includes 10 auto-graded tasks.

Project: Exploring Startup Trends with SQL Task 7 / 10

7. Funding Round Volatility Analysis

Our risk analysis team is examining volatility in funding rounds. They're specifically interested in dates where there was significant variation between the smallest and largest rounds. This indicates days when both very small and very large companies were receiving funding, which could signal unusual market activity. They also want to exclude days where some companies received no funding at all, as that skews the analysis.

Create a table showing the highest and lowest amount of money raised for each date in the `funding_round` table. Include the dates in your results. The resulting table should only have records where the lowest value is not equal to zero or to the highest value.

Relevant lessons

This task combines grouping with filtering on aggregated data. If necessary, review the following lessons: "Grouping Data: GROUP BY" and "Processing Data Within a Grouping: HAVING".

Result

id	first_name	last_name	company_id	twitter_username	created_at
63081	Gregory	Kim		gmoney75	2010-07-03 03:46:28

Theory

This project doesn't require a submission. It includes 10 auto-graded tasks.

Project: Exploring Startup Trends with SQL Task 8 / 10

8. Fund Activity Classification

For our investor clients, understanding the activity level of different venture funds helps them identify potential co-investment partners. Funds that invest in many companies are often seen as having broader networks, while those with fewer investments might have deeper industry expertise. We need to categorize funds by their activity level to help our clients find appropriate partners.

Create a field with three categories:

- **high_activity** – for funds that invest in a hundred or more companies
- **middle_activity** – for funds that invest in between twenty (inclusive) to a hundred companies (exclusive)
- **low_activity** – for funds that invest in fewer than twenty companies

Print all fields from the `fund` table and the new field with categories.

Relevant lessons

This task introduces conditional logic in SQL. If necessary, review the following lessons: "Replacing Empty Values: CASE".

Result

id	first_name	last_name	company_id	twitter_username	created_at	updated_at
63081	Gregory	Kim		gmoney75	2010-07-13 03:46:28	2010-07-13 03:46:28

Code

1 SELECT *
2 FROM people
3 WHERE twitter_username LIKE '%money%' AND last_name LIKE 'KN';
```

Run **Submit** **Task 7 ←** **Task 9 →** **Rate task** **Next →**

This project doesn't require a submission. It includes 10 auto-graded tasks.

Project: Exploring Startup Trends with SQL Task 9 / 10

9. Investment Strategy by Fund Activity

Building on our fund activity classification, our research team wants to understand how a fund's investment approach changes based on its activity level. Specifically, we want to know if funds that invest in more companies tend to participate in more funding rounds per company. This will help our clients understand different fund strategies and how broadly or deeply funds typically engage with their portfolio companies.

For each activity category you assigned in the previous task, calculate the average number of funding rounds the fund participated in. Round it to the nearest whole number. Print the categories and the average number of funding rounds. Sort the table by the average in ascending order.

Relevant lessons

This task combines CASE expressions with grouping and aggregation. If necessary, review the following lessons: "Replacing Empty Values: CASE", "Grouping Data: GROUP BY", "Sorting Data: ORDER BY".

Result

	id	first_name	last_name	company_id	twitter_username	created_at
63081	Gregory	Kim		gmoney75	2010-07-13 03:46:28

This project doesn't require a submission. It includes 10 auto-graded tasks.

Project: Exploring Startup Trends with SQL Task 10 / 10

10. Employee Education Impact on Startup Success

A heated debate has emerged among our clients about whether the educational background of startup employees correlates with company success. Some argue that highly educated teams are more likely to succeed, while others claim education has little impact. To settle this debate with data, we need to compare the education levels of employees at successful companies versus those that closed after limited funding.

We'll start by identifying companies that closed after just one funding round, then analyze the educational backgrounds of their employees.

First, make a list with the names of companies that closed down and had only one funding round while they existed.

Then, find the employees who worked at these companies and join with the education table to analyze their degree types.

Finally, calculate the average number of degrees per employee at these failed startups.

Result

	id	first_name	last_name	company_id	twitter_username	created_at
